Needle-like forceps

Endo Relief

Endo Relief forceps provide capability far beyond the realm of conventional forceps. The forceps tips are the same design as the 5-mm tips used in conventional laparoscopic surgery and can therefore be used for cholecystectomy, gastrointestinal procedures, as well as other forms of laparoscopic surgery. With comfort like this, as you monitor your actions onscreen, it's easy to forget that the shaft has a diameter of only 2.4 mm!

Fine craftsmanship enables the handle of the **2.4-mm** forceps to be detached and reattached.

The small-diameter trocar mini-port leaves a virtually invisible wound.

Ergonomic design

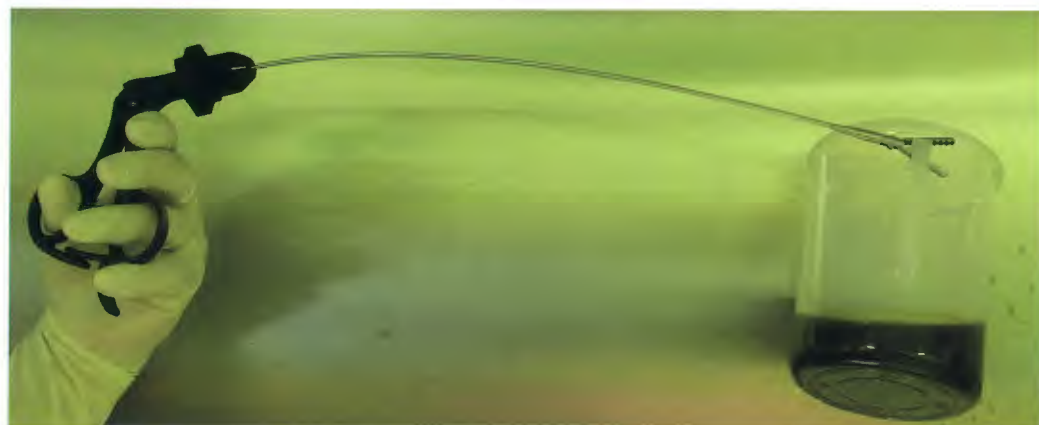

Smooth curvature extends from the 5-mm tips to the 2.4-mm diameter shaft.

Sensitive Operability

The tips can be rotated in the conventional manner through handle-side control. With such smooth operation, it's hard to believe the small diameter of these forceps.

Rigidity and Durability

A broad insertion section with a titanium alloy shaft provides high rigidity and exceptional durability.

Safety and Reuse

To deliver safety through a familiar feel and enable repeated sterilization, the tips have been designed with the same size and form as conventional 5-mm forceps.
